

In the Specification

Please amend the paragraph on page 12, lines 9-14 as follows:

a1
In step 614, the measuring application server program 524 connects to the relay module 560 at the specified port. Certain firewall configurations require special instructions to allow outgoing TCP/IP connections. In such cases, a standard SOCKS proxy, which can ~~running~~ run on the firewall 528, can be utilized to accomplish "sockification" of the measuring application server program 524. "Sockification" links the measuring application 524 with a SOCKS library in order to run a SOCKS protocol on top of a TCP/IP connection.

Please amend the paragraph on page 14, lines 5-10 as follows:

a2
In step 808, the measuring server 524 connects to the relay module 560 that is listening on the specified port number at the second port 562. In step 814, the measuring server 524 reads data through the ~~connected~~ connection with the relay module 560. In step 818, a determination is made whether the encrypted session key is included in the received data. If yes, in step 824, the measuring server 524 decrypts the encrypted session key by utilizing the private key of the measuring server 524.
